I just was surprised that you were out sampling on Nov. 10 and then the 19th.

I believe you are looking at waters associated with the sediment toxicity testing. As part of that test we monitor the overlying water and take a pore water sample in the lab from the sediments collected for the test. This can be identified by the event field which is "2014_NOV_TOX Waters_Upper Animas_A-034". Additionally the matrix field distinguishes tox water vs porewater. Locations where tox tests were conducted are listed in the attached SAP.

Dan – another database question. It appears that water quality samples were taken at a number of locations on the Animas on 11/10/2014 and then again on 11/19/2014. It also appears that porewater was taken on those days as well (only dissolved metals are listed). Is that right?

Also, samples were taken on both days at "A75EC" which we discussed earlier might be A73EC.
